NCERT Maths 10.5.3 Q14

EE23BTECH11201 - ABBURI TANUSHA*

Question: Find the sum of odd numbers between 0 and 50.

Solution:

Symbol	Value	Description
$x(0)$	1	first term of AP
d	2	common difference
$x(n)$	$(1+2n)u(n)$	n-th term of AP

TABLE I
GIVEN PARAMETERS

$$x(n) = (1+2n)u(n) \tag{1}$$

Last term of the given sequence is 49.

$$(2n+1) = 49 \tag{2}$$
$$2n = 48 \tag{3}$$
$$\implies n = 24 \tag{4}$$

Applying Z transform: From equation (**??**):

$$= \frac{1+z^{-1}}{(1-z^{-1})^2}, \quad |z| > |1| \tag{5}$$

For AP, the sum of first n+1 terms can be written as :

$$y(n) = x(n) * u(n) \tag{6}$$
$$Y(z) = X(z)U(z) \tag{7}$$
$$= \frac{1}{(1-z^{-1})^2} + \frac{2z^{-1}}{(1-z^{-1})^3}, \quad |z| > |1| \tag{8}$$

Using contour integration to find inverse Z transform:

$$y(n) = \frac{1}{2\pi j}\oint_C Y(z)z^{n-1}dz \tag{9}$$
$$= \frac{1}{2\pi j}\oint_C \left(\frac{1}{(1-z^{-1})^2} + \frac{2z^{-1}}{(1-z^{-1})^3}\right)z^{n-1}\,dz \tag{10}$$

The sum of the terms of the sequence is computed using the residue theorem, expressed as R_i, which represents the residue of the Z-transform at $z = 1$ for the expression $Y(z)$.

$$R_i = R_1 + R_2 \tag{11}$$

R_1 and R_2 are residues calculated at the poles of the Z-transform.

$$R_1 = \frac{1}{(2-1)!}\left.\frac{d(z^{25})}{dz}\right|_{z=1} \tag{12}$$
$$= 25 \tag{13}$$

$$R_2 = \frac{1}{(3-1)!}\left.\frac{d^2(2z^{25})}{dz^2}\right|_{z=1} \tag{14}$$
$$= 25 \times 24 \tag{15}$$
$$= 600 \tag{16}$$

$$R_i = 600 + 25 \tag{17}$$
$$\tag{18}$$

Sum of the numbers is $R_i = 625$.
